

Method for Planning a Repair of Mobile Machines

ABSTRACT OF THE DISCLOSURE

The present invention relates to a method for planning a repair of mobile
5 machines.

According to the invention, a description of the required repair is to be sent
together with a machine code from a local computer system to a central processor,
so that the latter, using machine-specific data, can produce a proposal on the
course of the repair and send it back. Due to the combination of general repair
10 data with machine-specific data, it is possible to plan the repair better, make
spares available and monitor execution. The data produced during the repair can
advantageously be used for subsequent work steps and analyses.
